### **Abstract**

There is widespread concern that the energy demand of the present century far surpasses the existing traditional sources, whose burning determine, because of GHG emissions, harmful effects on the environment by enhancing the natural greenhouse effect, the main reason for global warming.

In the current global ecological crisis and the limited degree of supportability of the environment, the authors of this paper highlight the importance of promoting biomass energy to achieve environmental protection as a component of sustainable development of human society in a clean environment free from environmental risks.

*Key words:* biomass, energy crisis, pollution, sustainable development
